

THE FIREFLY

The FireFly is used to prevent collisions with power lines and also to prevent roosting on towers and wires. The FireFly prevent collisions with power lines (both transmission and distribution) and also prevent birds roosting on towers and wires within a 10 meter radius of the installed product. As many bird species can see in the ultraviolet spectrum of sunlight, the birds will avoid the product.

The FireFly rotates in the wind both day and night to alert approaching birds to an obstruction in their flight path. The FireFly utilizes both reflective and uv absorption in the high impact plastic plate.

Complete with SnapFast clamp for power lines/conductors/cables/wires.

Specifications

Dimensions: 110 mm x 340 mm x 110 mm

Clamp Size Options: 6-16mm & 10-70mm

Hot stick attachment available for attaching and removal
